

Photonics I

(A-Vorlesung, WS)

Prof. Ferenc Krausz

Table of Contents:

I.	Introduction: modelling light and its advanced applications	1
II.	Ray optics	5
	Reflection and refraction at plane surfaces	6
	Focusing and imaging optics	8
	Light guides	10
	Matrix optics	11
	Matrices of simple optical components and systems	12
	The eikonal equation	14
III.	Wave optics	15
III.1	<i>Introduction</i>	15
	Monochromatic waves, frequency range of optical waves	15
	Complex representation and the Helmholtz equation	16
	Wavefront, relation between wave optics and ray optics	17
	Elementary waves, wavevector, phase velocity	18
	Fourier optics	20
	Simple applications: diffraction grating, Fresnel zone plate	22
	Transfer function of free space	23
	Optical Fourier transform, spatial filtering	24
	Smoothing the intensity profile of a light beam	27
	X-ray computed tomography	27
III.2	<i>Paraxial waves, Gaussian beams</i>	30
	Properties of Gaussian beams	31
	Optical resonators	36
	Hermite-Gaussian beams	39

IV. Electromagnetic optics	45
<i>/V.1 Microscopic & macroscopic fields, potentials, waves</i>	<i>45</i>
Conservation laws, field energy, field momentum, Poynting vector	46
Macroscopic (averaged) fields versus microscopic fields, Maxwell equations for macroscopic fields	48
Optically-induced charge displacement, generalised polarization, electric dipole approximation, constitutive law	50
Boundary conditions	53
Vector and scalar potentials, gauge invariance, Lorentz gauge, Coulomb gauge	53
Plane-wave approximation, energy density and flow rate (intensity) in a light wave, connection between intensity and electric field strength, impedance of free space	56
Paraxial electromagnetic waves, relation between electromagnetic optics and scalar wave optics	59
Electric and magnetic fields of a Gaussian beam	60
Microscopic radiation sources, the field of an oscillating dipole	62
<i>/V.2 Nonlinear polarization, light modulation and frequency conversion</i>	<i>66</i>
Second-order nonlinear susceptibility $\chi^{(2)}$: second harmonic generation, sum- and difference-frequency mixing, optical parametric amplification	69
Second-order nonlinear susceptibility $\chi^{(2)}$: phase and amplitude modulation and switching of light by means of the electro-optic effect	72
Third-order susceptibility $\chi^{(3)}$: nonlinear index of refraction, self-phase modulation, self focusing of laser light	75
<i>/V.3 Concepts of optical signal processing and optical communications</i>	<i>78</i>
All-optical switching, optical transistor	78
Bistable optical devices	79
Optical interconnections, analog signal processing	81
Optical interconnections in microelectronics	84
All-optical digital computing	85
Ultimate speed limits of optical signal processing	86
Optical communications	87

<i>IV.4 Theory of optical pulse propagation, dispersive and nonlinear effects, pulse compression, solitons in optical fibers</i>	91
General pulse propagation equation	91
Dispersion	92
Optical Kerr effect	93
Slowly varying amplitude approximation (in space and in time)	95
Nonlinear Schrödinger equation	95
Pulse propagation in a linear, dispersive medium ($\delta = 0$, $k_2 \neq 0$), Gaussian pulse, phase .. velocity and group velocity, frequency sweep, bandwidth limited pulse	96
Why is optics superior to electronics in transmitting information over large distances?	100
Pulse propagation in a dispersion-free, nonlinear medium ($k_2 = 0$, $\delta \neq 0$), self-phase .. modulation	100
Pulse compression	102
Pulse propagation in a dispersive, nonlinear medium with $k_2 < 0$, $\delta > 0$: optical solitons	103
Soliton evolution	104
V Semiclassical theory of light-matter interactions	107
<i>V.1 Classical and quantum mechanics of the electron in a light field</i>	107
Hamiltonian formulation of classical mechanics, the Poisson bracket	107
Point particle in a conservative potential	109
Charged particle in an electromagnetic field	110
Mathematical tools of quantum mechanics in Dirac's representation	112
Postulates of quantum mechanics	115
Unitary transformations – quantum mechanical pictures	116
The Schrödinger picture, the Schrödinger equation	117
The Schrödinger representation: wave mechanics	118
Quantum mechanics of a single particle in a conservative potential, centre-of-mass motion of a particle: Ehrenfest theorem	119
Quantum mechanics of the electron in an electromagnetic field, electric dipole approximation	120
Ensemble average – the density matrix	122
The time evolution of the density matrix	124

<i>V.2 Light-induced atomic transitions</i>	126
Perturbative calculation of the probability of quantum transitions	126
Rotating-wave approximation	128
Fermi's golden rule	129
Absorption and stimulated emission	129
Atomic transition cross sections, absorption and gain coefficients	131
Atomic rate equations	136
Principles of lasers, conditions for laser oscillation	138
Small-signal gain coefficient, saturation intensity	140
Pump threshold, slope efficiency	143
Conditions for efficient laser operation	144
The Neodymium:YAG laser: lamp pumping versus diode-laser pumping	145
The Titanium sapphire ($\text{Ti}:\text{Al}_2\text{O}_3$) laser	147
<i>V.3 Polarization response of matter: quantum theory of the constitutive law</i>	150
Density-matrix approach to the description of the interaction of a light wave with an atomic ensemble	150
Energy relaxation and dephasing	152
The density matrix equations of motion for resonant light-atom interaction	155
The classical electron oscillator model, the resonant dipole equation	155
Atomic susceptibility	157
Rederivation of the rate equations	158
Quantum mechanical origin of homogeneous line broadening	159
Connection between the atomic susceptibility and transition cross-section	159
Saturation intensity	160
Nonlinear constitutive law, power broadening	160
Range of validity of the atomic susceptibility and the rate-equation approximation	161
Large-signal response: Rabi flopping	162
Coherent light amplification by stimulated emission	165
Connection between the gain coefficient, atomic susceptibility and transition cross section	166
Saturation of homogeneously- and inhomogeneously-broadened transitions	167
VI Quantum optics	171
<i>VI.1 Quantization of the electromagnetic field</i>	171
Quantum theory of the harmonic oscillator	171
Second quantization, creation and annihilation operators	172

Number operator, number states176
Uncertainty products	177
The quantization of the radiation field in a resonator, definition of the photon	178
Travelling-wave quantization	182
Spontaneous atomic transitions	184
<i>VI.2 Quantum states of the electromagnetic field</i>	188
Single-mode approximation	188
Photon-number states	189
Coherent states	191
Classical coherent light field: expectation value of the field operator in the coherent state ..	195
Amplitude noise, phase noise	195
Squeezed states	197
