

Photonics II

(A-Vorlesung, SS)

Prof. Dr. Ferenc Krausz

Table of Contents:

VII	Relativistic optics	200
<i>VII.1</i>	<i>Electromagnetic fields in inertial frames of reference</i>	200
	Galilean transformation	200
	Postulates of Einstein's special theory of relativity	201
	Experimental verification of Einstein's relativity	201
	Lorentz transformation – derivation from the requirement of the relativistic invariance of Maxwell's equations	205
<i>VII.2</i>	<i>Lorentz invariance of physical laws and transformation of physical quantities</i>	210
	Some consequences of the Lorentz transformation: simultaneity is relative, Lorentz contraction, time dilatation	210
	Relativistic Doppler shift	211
	Addition of velocities	212
	Relativistic invariant expressions for momentum and energy of a particle	213
	Transformation of the force	216
	Transformation of electromagnetic fields	217
	Relativistic invariance of charge	219
	Fields of a moving charge	220
VIII.	Ultrafast Optics	224
<i>VIII.1</i>	<i>Introduction</i>	224
	Coherent light	224
	Spatial coherence: efficient transport & spatial concentration of light energy	225
	Temporal coherence: unparalleled spectral purity, definition of oscillation frequency with unmatched precision	227

Temporal & spatial coherence: phase-coherent generation of light waves at equidistant frequencies laser mode locking	227
Ultrashort pulse duration, ultrahigh peak power	229
Impact of ultrafast optics on science and technology	230
Frontier of ultrafast science: attosecond “oscilloscope”	232
Attosecond bursts trace the electric field of optical laser pulses	234
<i>VIII.2 Electromagnetic pulses: propagation & properties</i>	236
Propagation equation, group velocity, group velocity dispersion.....	236
Slowly-varying amplitude approximation	236
Frequency-domain description of electromagnetic pulses	238
Physical implication of the spectral phase shift $\varphi(\omega)$	240
Time-domain description of electromagnetic pulses: decomposition into carrier and envelope	241
Lowest-order propagation effect in the time domain: shift of the carrier with respect to the envelope	242
Time-dependent phase: instantaneous frequency, chirped pulse	245
Gaussian pulse modelling of propagation through a linear medium	245
Lowest-order pulse shaping effects preserve the shape of a Gaussian pulse	247
Phase shift first-order in frequency: a shift in time	248
First-order phase in time: a frequency shift	248
Phase shift second-order in frequency: positive or negative linear chirp	249
Phase shift third-order in frequency: satellite pulses	250
Phase shift fourth-order in frequency: leading and trailing pulse wings	251
Pulse characteristics: duration, time-bandwidth product	252
Time-bandwidth product	253
Temporal and spectral shapes of simple electromagnetic pulses	254
Transformation between wavelength and frequency	255
Bandwidth expressed in units of frequency, wave number and wavelength	256
Phase wrapping and unwrapping	256
Phase blanking	256
<i>VIII.3 Ultrashort laser pulse generation</i>	258
Concepts for mode locking	258
Active mode locking	259
Passive mode locking	259
Active mode locking by an electro-optic modulator	259
Active mode locking by an acousto-optic modulator	260
Analytic theory of active mode locking	261
Detuning of the modulation frequency from the axial mode separation	264

Time-domain modelling of mode locking	267
Master equation for (amplitude-modulation) active mode locking	268
Analytic theory of passive mode locking	269
Pulse forming/shortening device: saturable absorber	269
Master equation for passive mode locking by fast self-amplitude modulation	271
The optical Kerr effect : the key optical nonlinearity for femtosecond pulse formation	272
Master equation for passive mode locking including self-phase modulation	274
Soliton-like pulses in the limit of large gain bandwidth	276
.....	
Key ingredients of femtosecond solid state lasers: chirped multilayer mirrors & optical Kerr effect	277
.....	278
Workhorse of ultrafast science: the femtosecond Ti:sapphire laser	279
Amplified, high-energy femtosecond laser pulses	280
Measurement of femtosecond light pulses	
<i>VIII.4 Applications</i>	281
Optical telecommunications	282
Instrumentation for high-speed measurements: electro-optical sampling	283
Broadband THz (T-ray) generation and applications	285
Detection and measurement of THz waves	286
Electro-optic sensing	287
THz imaging in microelectronics, biology and medicine	288
THz imaging in medicine: tumour detection	289
Biological/medical imaging with ultrashort laser pulses	290
Two-photon/multiphoton microscopy	290
Third-harmonic microscopy	292
Optical coherence tomography, OCT	293
Nanoscale biological imaging with visible light: stimulated-emission depletion (STED) microscopy	296
Ultraprecise machining, structuring and cutting with femtosecond laser pulses	297
Mask repair	298
Periodic nanostructures	299
Pain-free dental treatment with femtosecond laser pulses	299
Precision surgery	300
Nanomachining with sub-10-fs laser pulses	300
Ultrafast metrology and control: tracking and steering microscopic motion	301
Chemical reaction control with femtosecond pulses	302

- IX Attosecond physics (Dr. Armin Scrinzi)
- X. Relativistic light-electron interactions (Dr. Michael Geissler)
- XI X-ray free electron lasers (Dr. Florian Grüner)
